1 Introduction.....	2
2 Using the barcode extension for SAXON.....	2

1. Introduction

This page describes how to generate barcodes in [SVG format](#) within an XSLT stylesheet that is processed with the [SAXON XSLT Processor from Michael Kay](#).

2. Using the barcode extension for SAXON

This package contains an extension for [SAXON](#) for generating barcodes in SVG format.

To make the barcode extension available in your XSLT stylesheets, do the following:

- Add `barcode4j.jar` to the classpath.
- Add the following namespace declaration to the root element of your XSLT stylesheet:
`xmlns:barcode="http://barcode4j.krysalis.org/org.krysalis.barcode4j.saxon"`
- Add the barcode namespace prefix to the extension element prefixes:
`extension-element-prefixes="barcode"`

Here's an example:

```
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:fo="http://www.w3.org/1999/XSL/Format"
  xmlns:barcode=
"http://barcode4j.krysalis.org/org.krysalis.barcode4j.saxon.BarcodeExtensionElementFact
  extension-element-prefixes="barcode">
```

To generate a barcode use simply use the "barcode" element in your template as indicated in the example:

```
<fo:block>
  <fo:instream-foreign-object>
    <barcode:barcode message="{msg}">
      <barcode:codel28>
        <barcode:height>8mm</barcode:height>
      </barcode:codel28>
    </barcode:barcode>
  </fo:instream-foreign-object>
</fo:block>
```

The XML syntax used within the barcode element is the [Barcode XML](#).
